3. The application has been amended as follow:

4. In the claim:

25. (Currently Amended) A computer program embedded in a tangible storage ~~medium~~ memory for controlling a computer system for delivering television where each television channel is carried over a different multicast group, and subscribers join a particular multicast group in order to receive a particular channel at a host device, the computer program comprising:

maintenance logic programmed to maintain multicast group access control information; and

distribution logic programmed to distribute the access control information to at least one access device using a predetermined push mechanism in order to reduce delay in authentication when a host device changes television channels, wherein the

access device is operable to transmit the channel to the host device and is logically closer to the host device than the apparatus for distributing access control information, whereby the access device receives the access control information before it is needed, and whereby access control information is moved closer to the host device, thereby facilitating changing channels by reducing authentication delay.

45. (Currently Amended) A computer program embedded in a tangible storage ~~medium~~ memory for controlling a computer system for delivering television where each television channel is carried over a different multicast group, and subscribers join a particular multicast group in order to receive a particular channel at a host device, the computer program comprising:

distribution logic programmed to receive multicast group access control information from a distribution device using a predetermined push mechanism in order to reduce delay in authentication when a host device changes television channels;

host interface logic programmed to receive a request from a host device to join a television channel multicast group; and

access control logic programmed to determine whether the host device is authorized to join the television channel multicast group based upon the access control information, wherein the host interface logic is executed by a device that is logically closer to the host device than the distribution device, whereby the access device receives the access control information before it is needed, and whereby access control

information is moved closer to the host device, thereby facilitating changing channels by reducing authentication delay.

Reasons for Allowance
